

# U-value Calculations Checklist

# U-value Calculations Checklist

---

## **1. Build specification for all heat loss areas to be modelled**

This should be a layer-by-layer description of all the building materials used, including thickness of each material, make and model of any insulation, any air spaces, and any 'bridging' or breaks within the insulation layers (such as where insulation is installed between rafters.) We use all of this information to calculate heat loss.
